[matrix]

An open network for secure, decentralized communication.

The Problem

Centralization

- All data in one place.
- One point of failure.
- One point to breach.

Privacy

- Lack of control for users.
- Corporate controlled data

Technical hassle

- Multiple apps that cannot talk to each other.
- Wastage of server spaces and other resources

Solution

a set of openly standardised HTTP APIs for the real-time synchronisation and persistence of arbitrary JSON over a federation of servers.

[matrix]

___

What does matrix bring to the table?

Decentralization

User controlled Data

One Standard

Decentralised cryptographically signed conversation history.
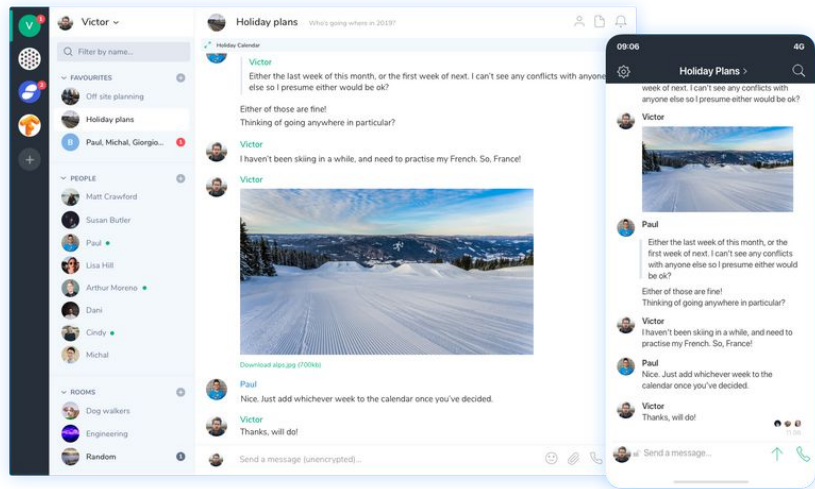

Uses federated servers so that no one is in control of the data

One standard on which multiple messaging clients can be developed on.
